

Heavy Duty Timer Instructions

1. To set the present time, turn the round dial clockwise until the Present Time Arrow in the center of the timer points to the present time.

Present Time Arrow

2. To set the timer, make sure the Present Time Arrow is pointing to the correct time. Push the black segments downward to turn the timer ON during that time period. Each segment represents 15 minutes. (Ex. – To turn the timer on for 1 hour, you would push down 4 black segments next to each other).

3. When you have pushed down all of the black segments for the period of time you want the timer to be ON, slide the red Manual On Switch down to the T (timer) position. Plug the timer into an outlet, and then plug the device you want to control into the outlet on the front of the timer. You can automate more than one appliance if a multi-outlet device is plugged into the timer. All appliances should have a total rating of less than 1725 watts. Push the Manual On Switch up to activate the manual ON position. The Power Indicator Light lights up when power is being supplied to appliance(s) plugged into the timer.
